Does not appear to function in the programmed death of non-neuronal cells. May serve as an endogenous antagonist competing for substrate with functional kinases that act to promote neuronal cell survival. FISSUE SPECIFICITY: Detected only in the lung. Not detected in the heart, brain, spleen, liver, skeletal muscle, kidney and testis. INDUCTION: Expression induced during programmed cell death evoked in neuronal cells by NGF-depletion.

SIMILARITY: Contains 1 protein kinase domain.

"Genetic evaluation of the function of SNF1 in Candida tropicalis.";
Submitted (MAR-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Essential for release from glucose repression. It
interacts and has functional relationship to the regulatory
protein SNF4. Could phosphorylates CAT8 (By similarity).

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

SUBUNIT: Binds to the calcium/integrin-binding protein (CIB). This
interaction probably occurs via the POLO-box domain.

SUBCELLULAR LOCATION: Membrane-associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TISSUE SPECIFICITY: Transcripts are highly detected in placent lung, followed by skeletal muscle, heart, pancreas, ovaries an kidney and weakly detected in liver and brain. May have a shor half-live. In cells of hematopoietic origin, strongly and exclusively detected in terminally differentiated macrophages. Transcript expression appears to be down-regulated in primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: Serine/threonine protein kinase involved in regulating phase functions during the cell cycle. May also be part of the signaling network controlling cellular adhesion. In vitro, is able
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GO:0006468; P:protein amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inducible kinase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Serine/threemine protein kinase involved in regulating M phase functions during the cell cycle. May also be part of the signaling network controlling cellular adhesion. In vitro, is able to phosphorylate CDC25c and casein (By similarity). CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein. SUBCNIT: Binds to the calcium/integrin-binding protein (CIB). This interaction probably occurs via the POLO-box domain. SUBCELLULAR LOCATION: WHEN INDUCED, IT TRANSLOCATES INTO THE DENORITES OF ACTIVATED NEURONS.
                                                                                                                                                                                                                                                                                                                                                        INDUCTION: By the intense activity associated PTM: PHOSPHORYLATED AS CELLS ENTER MITOSIS ANI CELLS EXIT MITOSIS (BY SIMILARITY).
SIMILARITY: Belongs to the Ser/Thr family of I
                                                                                                                                                                                                                                                                                             CDC5/Polo subfamily.
SIMILARITY: Contains 2 POLO box domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TISSUE SPECIFICITY:
